

EVALUATION SPLIT

Source subjects

Train / validation only
Frozen EEG backbone
+ shared population model

Held-out subject

Earlier half: labels / context
Later half: fixed query trials

ATTRIBUTION CONTROLS

Capacity control

Real / shuffled / default context

Information mismatch

Own / swapped parameters

Training-budget control

Population 1× / 2× / 4×
Meta-learning / continuation

TWO DISTINCT OUTCOMES

Report both contrasts

$\Delta = \text{own} - \text{population}$

$U = \text{own} - \text{swapped}$

$U > 0$ does not imply $\Delta > 0$

Donor: another held-out subject
in the same dataset and fold.
Fit uses earlier-half labels.

Population reference: convergence unconfirmed. Continuation: scheduled outer updates matched.
